

REFERENCE LIST

G1000 SMOKE DENSITY MONITOR

The G1000 Smoke Density Monitor was developed in 1998. It is used to monitor smoke emissions from all kinds of combustions and to monitor the soot contamination in inert gas. It is a very robust system that is well suited to resist heat and vibrations in and around smoke stacks. Today, the G1000 Smoke Density Monitor is installed on cruise ships, tankers, refineries and power plants. The end customers are not always known to us. If you need further information, please do not hesitate to contact us.
